

Gap Tool

One-page purpose overview

A plain-English explanation of what the app does and why it exists.

In simple terms: Gap Tool helps an advisor show a client where a financial protection gap may exist. It compares a client's current situation against a potential disruption event, subtracts existing protection, and makes the remaining gap easier to see and discuss.

The main purpose

Gap Tool is designed to make hidden financial exposure visible. It helps answer: if a major risk event happened, what shortfall or uncovered need could appear?

What it actually does

It takes basic client facts, applies simple scenario logic, counts existing savings, benefits, or coverage as offsets, and shows the remaining gap in plain language.

What it supports

It gives the advisor a clearer starting point for conversation. It does not replace advisor judgment, compliance review, or professional planning analysis.

The big-picture logic

1. Start with client facts

Income, expenses, age, dependents, debts, savings, existing benefits, and current coverage.

2. Select a risk scenario

Examples may include death, disability, unemployment, or liability/lawsuit exposure.

3. Estimate potential impact

The tool models how the scenario could affect income, reserves, assets, or household stability.

4. Subtract existing protection

Savings, employer benefits, current insurance, spouse income, or liability protection may reduce the exposure.

5. Show the remaining gap

The tool presents the uncovered shortfall through simple numbers, charts, timelines, and summaries.

6. Guide the next discussion

The advisor uses the output to help the client understand the issue before discussing possible next steps.

What Gap Tool is

A client-meeting support tool for gap analysis. It helps advisors explain potential financial exposure, existing offsets, and remaining uncovered risk in a more understandable way.

What Gap Tool is not

It is not a full financial plan, not a product recommendation engine, not a quote tool, and not a substitute for licensed advice, compliance review, legal advice, or tax advice.

Plain-language bottom line: Gap Tool helps answer: "What financial gap could appear, what already helps cover it, and what still needs to be discussed?" Outputs should be treated as illustrative gap-analysis scenarios, not guarantees or final recommendations.
